06:45 A trip to the garden.

There is mildew in the grapes, I don't think we will have fruit to eat this year. I wonder if I should prune it drastically this autumn?

The slug trap is working. The beer attracts them, but now it has a layer of fungus on the whole surface, I must ask my sister if I should change it. I took a photo to send it to her on WhatsApp.

The herbs are doing really well. DGA is having a good effect. I have been careful to apply it to the soil of the pots to make sure the leaves can be eaten fresh. The basil has a wonderful smell!!

Sweet peas are beginning to grow. The seeds I put to fill in the gaps have not yet germinated.

7:24 The sun is a little brighter now. ☺

Beans: Those that germinated and were not eaten ~~gone~~ by (?) are now growing well. The second and third lot of seeds has now germinated but there are still gaps. I need to water them today. I wonder what eats the cotyledons after germination.

Sweet peppers: doing well but still not flowering.

Tomatoes: Very large plants. Must take a photo for my sister. Lots of flowers. I planted them too densely. Next year I should leave more space.

I will need to put longer sticks to support some of them!

Carrots: Now fully grown. We should harvest them in a couple of weeks.

Next DGA application: sweet peppers

It is nice to make this notes, helps me enjoying the garden and focus on what is doing well and my next tasks.

Now I must finish watering and get ready for my meeting with Nura.
